The Plexis KeyInjector Serial Software Wedge Serial Key is used to inject serial data into applications. The wedge is used with a computer equipped with a serial port connected to the Plexis KeyInjector. Information may be input into application software by connecting the serial port to the wedge. KeyInjector is a Windows compatible program that allows serial data to be injected into application programs that have a Windows API. As the wedge outputs serial data, the wedge is connected to the serial port on a computer using the Plexis KeyInjector software. The wedge software allows all or any number of serial ports to be monitored. The wedge software allows information to be entered directly into the program without changing the keyboard settings. The wedge software provides many advanced features. Uniquely, the wedge software runs off of a USB key, making the wedge portable. When the wedge is connected to the serial port, the wedge software analyzes the data. The wedge software determines if the data represents a transmission from the wedge. The wedge software automatically outputs the serial data from the wedge as if the wedge was connected to the serial port. The wedge software interfaces with any serial port on a Windows system. The wedge software supports most popular communication protocols and standards. Most serial devices have serial data port pins which are compatible with the wedge software. The wedge software allows the serial data to be sent to any window. The wedge software can send data to a window that already has input fields and a keyboard. The wedge software can also send data to any active program on the system. The wedge software sends the serial data in a format compatible with the application. The wedge software does not effect the character set. The wedge software supports several applications which are compatible with the wedge software. These are Microsoft Excel, Access, Word, VB and many others. When you activate the wedge software, the wedge software performs the following functions: · Sets the serial data port to the wedge · Checks the serial data is valid · Analyzes the serial data · Outputs serial data from the wedge · Records serial data into application data fields · Send serial data to the application that the serial port is connected to The wedge software does not support the following functions: · Analysis of the application language or character set. · Changing the keyboard settings of the program. · Changing the application window. The wedge software is a key component of the Plexis KeyInjector Software Wedge. The wedge software works with any
