A colonoscopy is a test that can detect signs of cancer of the large intestine. Colons are the interior walls of the large intestine, the colon. A healthy colon is a smooth and pink wall, because of the red blood inside the wall. A colonoscopy is a visual examination of the entire colon, to see if it's normal. A colonoscopy can also detect other diseases, such as a polyp or ulcer, which can be dangerous if not treated right away. A colonoscopy is always done by a doctor in an office, hospital, or clinic. It takes one to two hours and is done with the patient lying on a long table with her head raised. The doctor inserts a thin tube that has a light and a camera through the rectum into the colon and into the lower part of the large intestine. Your doctor will pull back your colon for the examination. The area between the opening and the rectum is called the sigmoid colon. That's the part of the colon that most often has polyps or ulcers. The doctor can use the camera to see if anything is there. He or she can also use other tools to see if there is something in the colon, to find polyps and to take a small piece of the tissue for a biopsy to make sure there is no cancer. A colonoscopy is a very simple procedure, but some people need to be sedated to keep them still, so it's not always as easy as it sounds. When to have a Colonoscopy You should have a colonoscopy if you are at increased risk for colon cancer. These include being 50 years old or older, with a family history of colon cancer, with a history of polyps or colitis, or having a first-degree relative, such as a mother or father, who had colon cancer. You should also have a colonoscopy if you have symptoms of a polyp or ulcer, or if you have had bleeding from the large intestine. How your doctor can help Your doctor will ask you how many times you've had a colonoscopy or how long it's been since your last one. He or she will ask your age, what any symptoms you had, and any medications you might be taking. You'll be asked about any chronic diseases you have, such as diabetes, heart disease, or kidney disease. Your doctor will talk to you about getting
